yun-hang.cho@Sheffield.ac.uk

4TH – 5TH APRIL 2017
ANNUAL CONFERENCE

Introduction

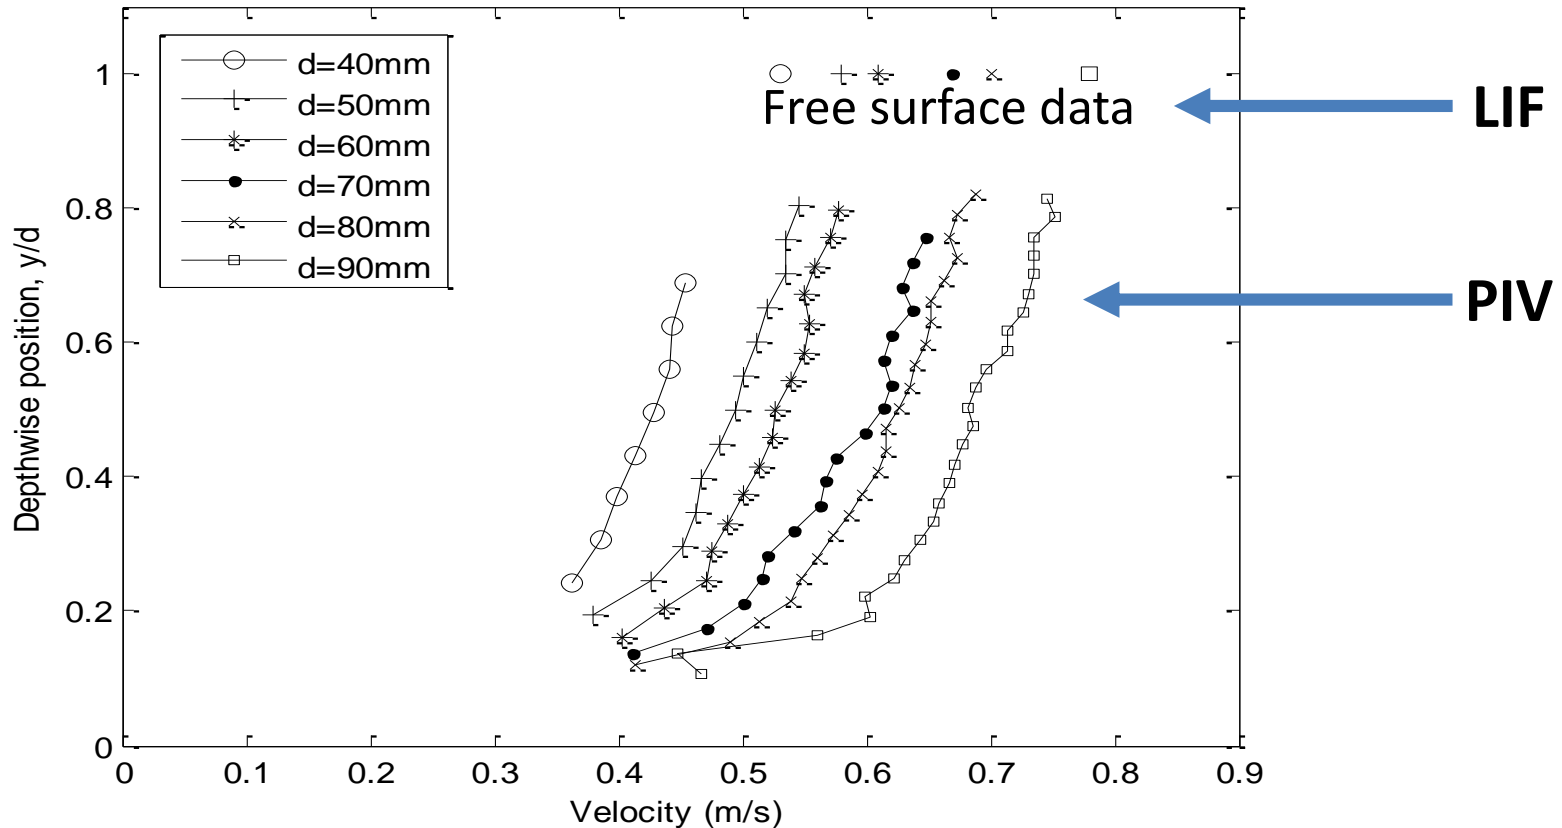

The
University
Of
Sheffield.

Imaging techniques have been shown to be capable of capturing surface velocity field..

(with good lighting, and perhaps seeding)

Introduction

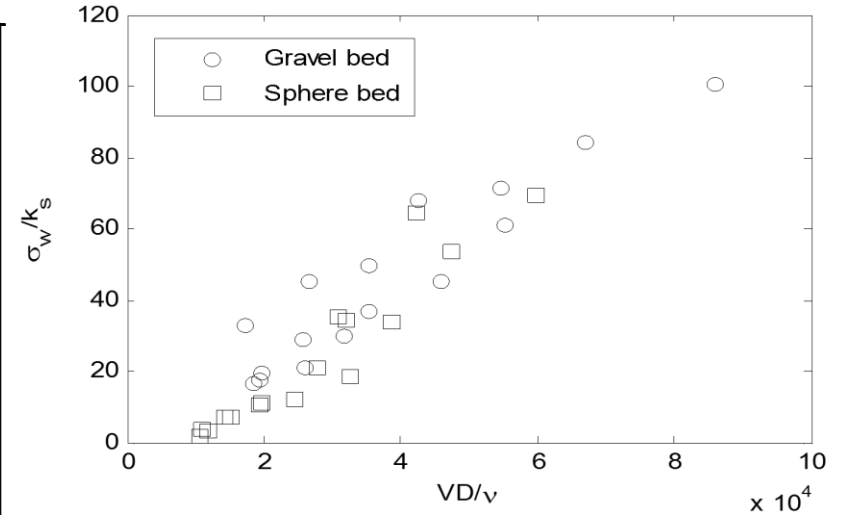

Which relates to mean flow velocity...
(assuming a velocity profile/ratio)

Introduction

**But we believe the free-surface pattern
(fingerprint) can tell us much, much more...**

Introduction

... such as turbulence length scales, hydraulic roughness, shear velocity, Reynolds number, etc...

Introduction

However:

Most surface measurements are 1D/2D, and too costly for mass field deployment.

Methodology

Microsoft Kinect sensor

480x640 RGB and Depth

Used before for large coloured waves in wave tank. Nichols & Rubinato (2016) suggested use for turbulence waves.

Methodology

Microsoft Kinect sensor
Wave probes
Colourant: 1% milk
Wave generator (x54)
Flow turbulence (x6)

Methodology

Spatial calibration →

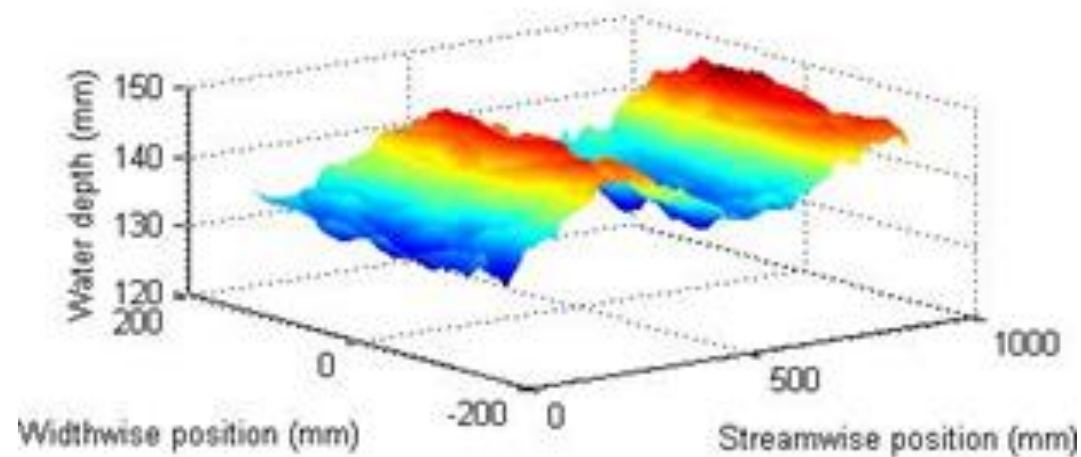

Depth calibration ↓

Results: Gravity wave data

- Similar mean level
- Similar frequency
- Phase difference (lag)
- Lower amplitude
- True for 54 different gravity wave conditions

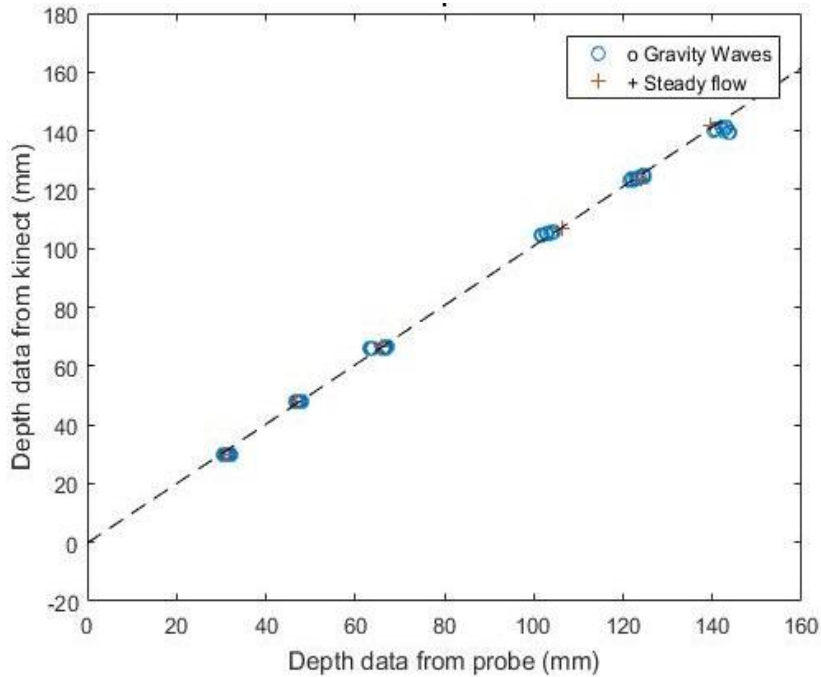

Results: Turbulence-generated waves

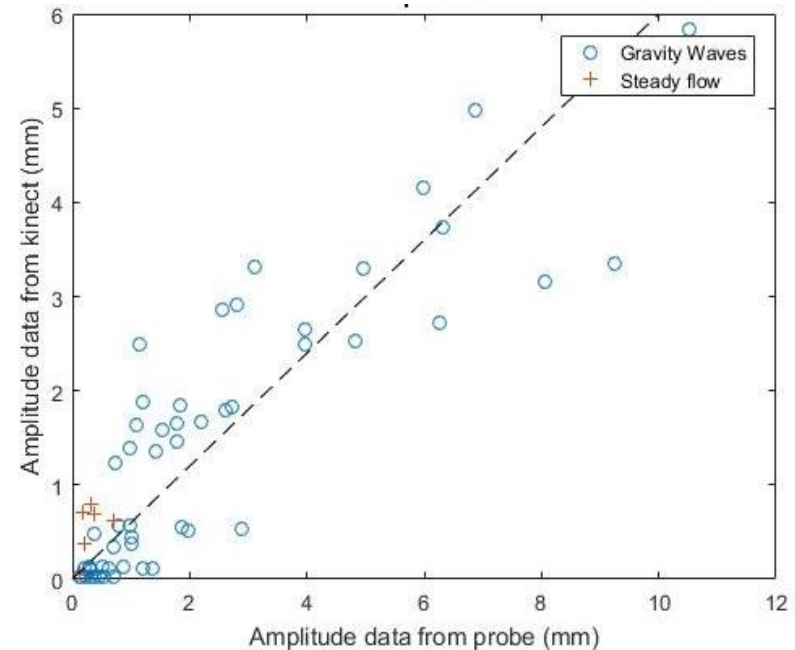

- Similar
- Need detailed comparison

Results: Mean depth and wave amplitude

- Mean level is good
- Amplitude is lower but related

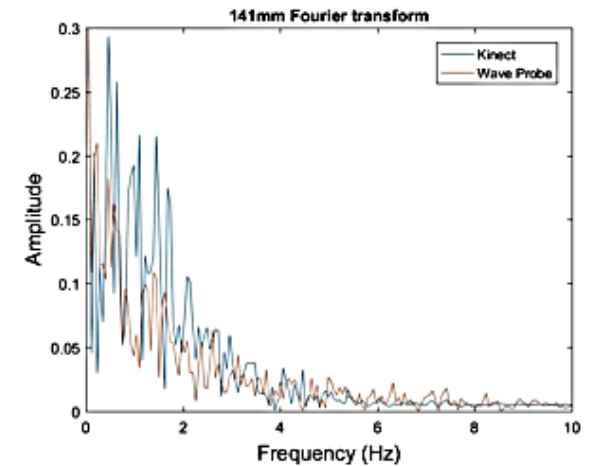

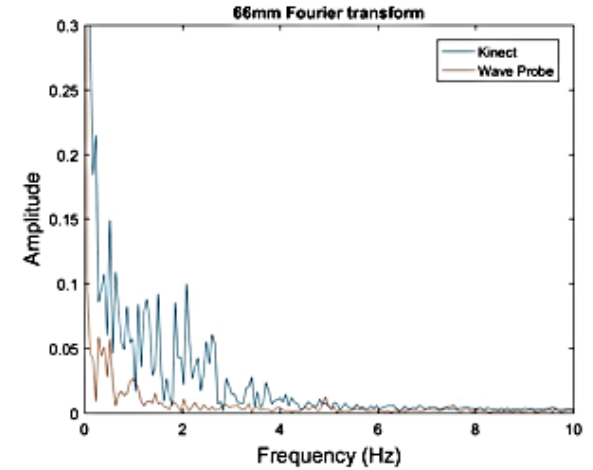

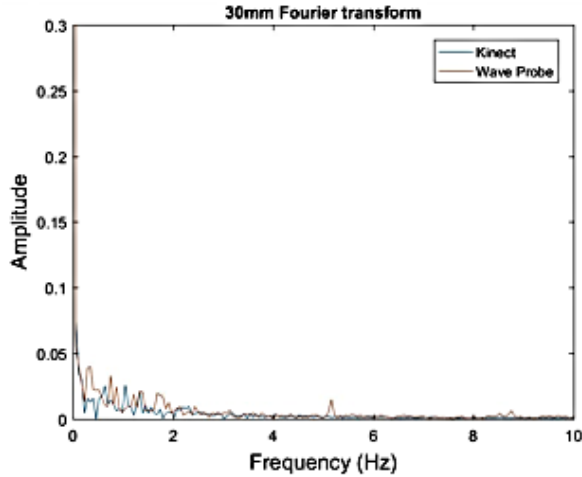

Results: Gravity wave frequency

- Mostly similar frequencies
- Though specified as 30 Hz sampling rate, Kinect actually samples at a varying frequency between 25.9 and 31.9 Hz.

Results: Turbulence-generated wave frequency

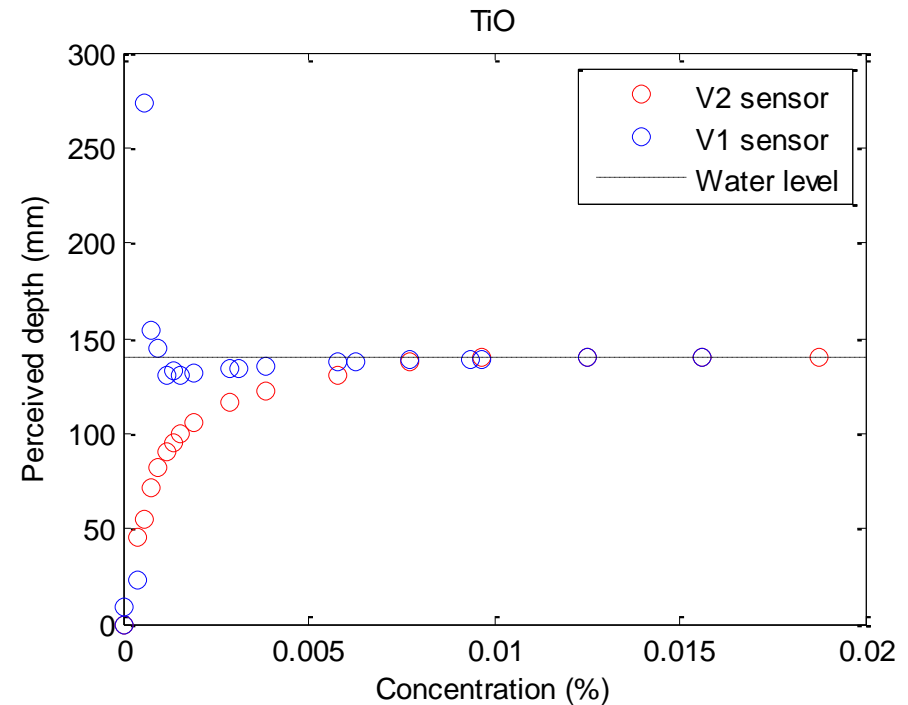

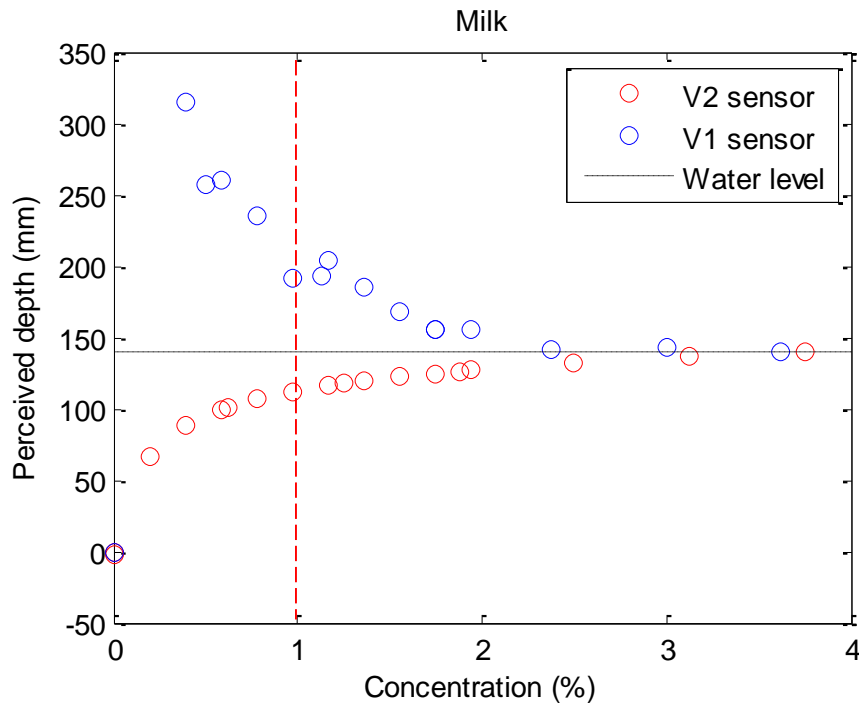

Evaluation

- Check threshold concentration
- Check stability over time
- Try new colourant (TiO)
- Try new sensor (Kinect V2)

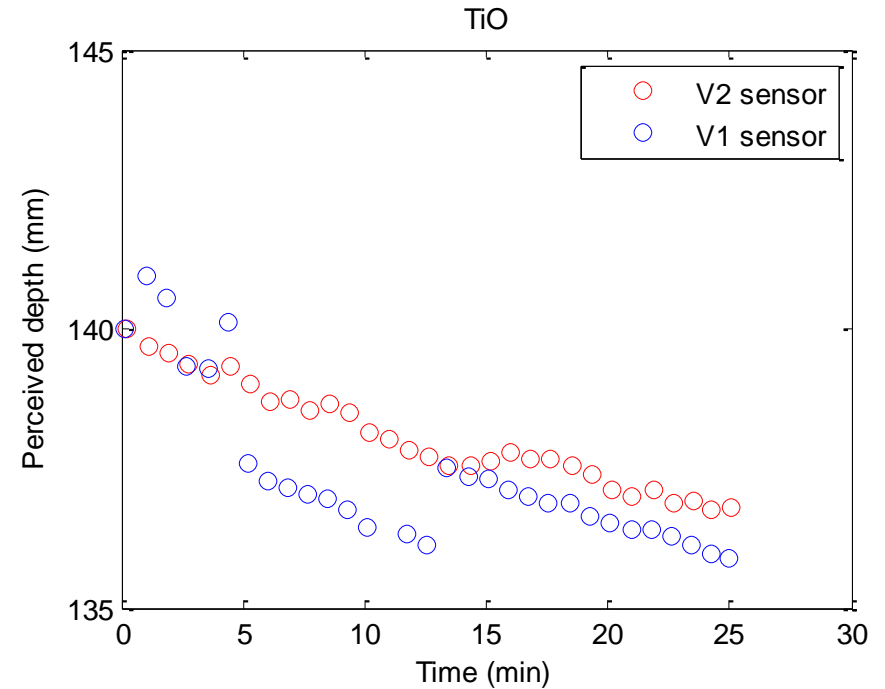

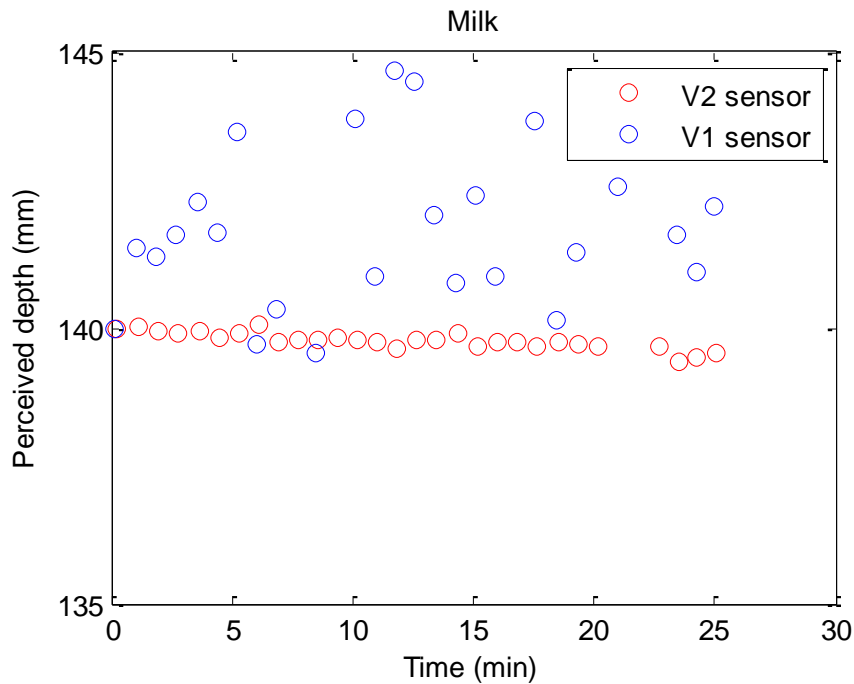

Evaluation: Concentration threshold

- 1% Milk was too low in this case
- TiO requires much lower dosage
- V2 sensor more reliable?

Evaluation: Stability over time

- V1 sensor very unstable with milk
- Both colourants settle over time, TiO more

Conclusions

- V1 sensor can be unstable → repeat experiments using V2 sensor
- Milk threshold appears to vary from sensor to sensor → check threshold for each sensor prior to testing
- TiO requires lower dosage → further comparison required.
- **Ultimately, this technique can allow remote measurement of free-surface pattern, and hence the underlying turbulence field and flow processes.**
- **Can it be used in clear water?**
- **Can our algorithms be applied to LSPIV camera data?**
